

Information for Developers:

Projects usually require practical implementation of the module content. These assess the extent to which certain skills have been achieved and demonstrated in an applied manner.

Projects provide students an opportunity to learn by doing activities or tasks relevant to their world of work or providing future work experience. This assessment tool is also able to assess other soft skills like systems thinking, management skills, time management, and resource allocation. This is a good option when students are required to do an activity/ project in a set time period, a day/ two days, or a week.

An important consideration here, is whether the project can be completed in the time limits? Does the limit on time reflect what students will confront in industry or their particular discipline?

This is also an assessment approach that would be suitable for both group and individual activities.

Case Study Background:

You are a software quality assurance engineer at a leading technology company that specialises in developing innovative software products. The company is currently working on a cutting-edge project—a virtual reality (VR) application that integrates with a newly developed online payment system. This VR application aims to revolutionise online shopping by providing users with an immersive shopping experience. Your role is crucial in ensuring the reliability, security, and quality of both the VR application and the online payment system.

You are required to compile a report based on the sections that follow.

Report Title**Implementing Tests (20 Marks)**

- a. Describe at least three different types of tests that could be implemented for the VR application. Provide a brief explanation of each test type and its purpose.
- b. Discuss the challenges and considerations in implementing tests for VR applications compared to traditional software applications. How do these differences influence the testing approach?

Reporting on Tests (35 Marks)

- a. Explain the significance of test reporting in the software development lifecycle. Discuss the key components that should be included.
- b. Based on the tests implemented for the VR application, create a sample test report outlining the results of each test type. Include details such as test case descriptions, test results, and any identified issues or defects.

Building a Test Environment (20 Marks)

- a. Outline the steps involved in building a suitable test environment for both the VR application and the online payment system. Consider factors such as hardware, software, and network configurations.
